Apply Cloudify patches

- Requirements
- Download patchify
- To list or apply recommended patches:
- To list or apply recommended patches when offline:
- To apply an individual patch:

Patchify is a tool which delivers patches to single Cloudify manager, or to Cloudify cluster HA

Link: https://github.com/cloudify-cosmo/patchify

It works with Cloudify manager versions 4.5.5 and newer.

Requirements

CFY CLI profile must be configured with SSH credentials. For cluster profile all cluster nodes in the profile must be configured with SSH credentials.

Download patchify

Two methods:

- git clone https://github.com/cloudify-cosmo/patchify.git
- curl https://github.com/cloudify-cosmo/patchify/archive/master.zip --output master.zip # Unzip master.zip file.

To list or apply recommended patches:

- 1. Make sure that cfy is pointing at the manager/cluster you are intending to update.
- 2. ./patchify manager-updates list
- 3. ./patchify manager-updates apply # Only necessary if there are any updates to apply

To list or apply recommended patches when offline:

- 1. Make sure you have cloned the latest version of this repo (this will need to be updated every time you check for recommended patches).
- 2. Make sure that cfy is pointing at the manager/cluster you are intending to update.
- 3. The following commands must be run from within the repo, or the full path to the repo's central_registry and patch_files must be provided:
 - a. ./patchify manager-updates list -c file://\$(pwd)/central_registry
 - b. ./patchify manager-updates apply -c file://\$(pwd)/central_registry -r file://\$(pwd)/patch_files --install-patch-command # Only necessary if there are any updates to apply

To apply an individual patch:

- 1. Make sure cfy is pointing at the manager/cluster you are intending to update. If you point at another manager (or none), you should get helpful errors
- 2. ./patchify apply -p patch_files/<patch_name>.json
